

*Self-Consistent Simulations of Beam and Plasma Systems*

Steven M. Lund, Jean-Luc Vay, Rémi Lehe and Daniel Winklehner

Colorado State U., Ft. Collins, CO, 13-17 June, 2016

## W2. Introduction to the Warp framework

Jean-Luc Vay

Lawrence Berkeley National Laboratory

(with many contributions from D. Grote & S. Lund)

3

## Outline

- Intro
- Installing & running Warp
- Units and variables
- Warp script outline
- Particles
- Simulation mesh
- Boundary conditions
- Fields solvers
- Internal conductors & lattice
- Stepping
- Diagnostics and plots
- Saving/retrieving data
- Command line options

Warp is a very large code and we will only present a snapshot of the possibilities. More will be presented in the examples.

2

## History

- 1989: code started by A. Friedman; electrostatic PIC with 3D Poisson solver in square pipe geometry using sine transforms
  - with inputs and contributions from I. Haber.
  - name Warp chosen to denote speed, later also denotes “warped” Fresnet-Serret coordinates used in bends.
- 1991: D. Grote joins and becomes main developer, contributing more general 3D Poisson solver and beam loading module, followed by countless contributions since.
- 1995: S. Lund start contributing, in particular beam loading module using various distributions, such as waterbag, Gaussian, and thermal.
- Late 1990's: R. Kishek begins using Warp to model experiment at UMD, and in undergraduate and graduate classes. He contributes some code, including various diagnostics used at UMD and UMER, and standardized machine description for UMER.
- 2000: D. Grote develops Forthon, transitioning Warp from Basis to Python, and parallelizes Warp using MPI (replacing previous PVM parallelization).
- 2000: J.-L. Vay joins the development team and contributes the EM solver, ES and EM AMR, boosted frame, Lorentz invariant particle pusher, etc.
- 2015: R. Lehe joins the development team and contributes the EM Circ solver, OpenPMD and hdf5 IO, mpi4py; also develops spectral EM circ stand-alone module FBPIC (coupling to Warp in development)

3

## History

- Other contributors include:
  - Ron Cohen: drift-Lorentz mover, other fixes.
  - Bill Sharp: Circe module.
  - Michiel deHoon: Hermes module.
  - Sven Chilton: generalized KV envelope solver (with S. Lund).
  - Arun Persaud: making Warp PEP8 compliant, various fixes and updates, also adding capability to download parameters and diagnostic output from NDCX-II run database, automatically run Warp, and overlay results with experimental data, thereby facilitating machine optimization.
  - Henri Vincenti: fixes to Circ, OpenPMD, and EM solver; development of optimized PICSAR kernel with tiling, OpenMP and advanced vectorization.
  - Manuel Kirchen: mpi4py interface, boosted particle diagnostics and FBPIC module.
  - Patrick Lee: boosted particle diagnostics, other fixes.
  - Irene Dornmair: EM initialization for relativistic beams.

4

## Warp: A Particle-In-Cell framework for accelerator modeling

- Geometry:** 3-D (x,y,z)  axisym. (r,z) + FFT( $\theta$ )  2-D (x,z)  2-D (x,y) 
- Reference frame:** lab  moving-window  Lorentz boosted   
 $z$   $z-vt$   $\gamma(z-vt); \gamma(t-vz/c^2)$
- Field solvers**
  - electrostatic/magnetostatic - FFT, multigrid; AMR; implicit; cut-cell boundaries
  - Versatile conductor generator accommodates complicated structures 
  - Automatic meshing around ion beam source emitter 
  - Fully electromagnetic - Yee/nodal mesh, arbitrary order, spectral, PML, MR
- Accelerator lattice:** general; non-paraxial; can read MAD files
  - solenoids, dipoles, quads, sextupoles, linear maps, arbitrary fields, acceleration.
- Particle emission & collisions**
  - particle emission: space charge limited, thermionic, hybrid, arbitrary,
  - secondary e- emission (Posinst), ion-impact electron emission (Txphysics) & gas emission,
  - Monte Carlo collisions: ionization, capture, charge exchange.

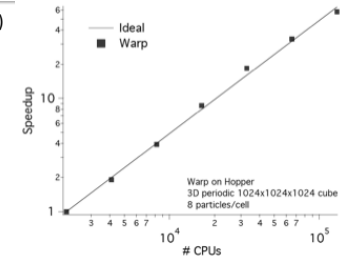

5

## Warp is parallel, combining modern and efficient programming languages

- Parallelization:** MPI (1, 2 and 3D domain decomposition)

Parallel strong scaling of Warp  
3D PIC-EM solver on Franklin  
supercomputer (NERSC)

- Python and FORTRAN\*:** “steerable,” input decks are programs

```

From warp import *
...
nx = ny = nz = 32
dt = 0.5*dz/vbeam
...
initialize()
step(zmax/(dt*vbeam))
...
    
```

← Imports Warp modules and routines in memory  
 ← Sets # of grid cells  
 ← Sets time step  
 ← Initializes internal FORTRAN arrays  
 ← Pushes particles for N time steps with FORTRAN routines

\*<http://hifweb.lbl.gov/Forthon> (wrapper supports FORTRAN90 derived types) – [dpgrate@lbl.gov](mailto:dpgrate@lbl.gov)

6

## Warp's versatile programmability enables great adaptability

<b>Laboratory frame</b> Example: Alpha anti-H trap 	<b>Standard PIC Moving window</b> Example: Beam generation and transport 	<b>Lorentz Boosted frame</b> Example: Laser plasma acceleration 
<b>Steady flow</b> Example: Injector design 	<b>Non-standard PIC</b> Example: electron cloud studies 	<b>Quasi-static</b> Example: electron cloud studies 

7

## Installing Warp

Installations instructions are given at :

<http://warp.lbl.gov/home/how-to-s/installation>

Pre-requisite:

C and F95 compiler, python, numpy, Forthon, pygist or matplotlib

Download Warp from bitbucket:

<https://bitbucket.org/berkeleylab/warp/downloads>  
 download Warp\_Release\_4.4.tgz

Install

```

cd in the Warp/pywarp90 directory
make install
# see more details on website, including how to install in parallel
    
```

Update

```

git pull
cd pywarp90
# serial
make install
# parallel
make pinstall
    
```

8

## Running Warp

A Warp input script is a Python script, e.g. script.py.

Running interactively:

```
% python -i script.py
```

Running non-interactively:

```
% python script.py
```

Documentation and help at the command prompt:

```
>>> warpdoc()
>>> warphelp()
>>> doc('name') -- or -- In [2] name? with Ipython
>>> name+TAB+TAB -- or -- In [2] name+TAB with Ipython for auto-completion
```

9

## Warp units

Warp units are M.K.S. with the notable exception of energy, which is in eV.

A number of conversion constants are provided for convenience.

Example:

```
>>> piperad=2.*inch
>>> piperad
0.0508
```

```
inch = 0.0254 # inches to meter
nm = 1.e-9 # nm to meter
um = 1.e-6 # um to meter
mm = 1.e-3 # mm to meter
cm = 0.01 # cm to meter
ps = 1.0e-12 # picosecond to second
ns = 1.0e-9 # nanosecond to second
us = 1.0e-6 # microsecond to second
ms = 1.0e-3 # millisecond to second
kV = 1.0e3 # kV to V
keV = 1.0e3 # keV to eV
MV = 1.0e6 # MV to V
MeV = 1.0e6 # MeV to eV
mA = 1.0e-3 # mA to A
uC = 1.0e-6 # micro-Coulombs to Coulombs
nC = 1.0e-9 # nano-Coulombs to Coulombs
deg = pi/180.0 # degrees to radians
```

10

## Mathematical and Physical Constants

Those are provided to aid in the setup.

```
Mathematical Constants
pi = 3.14159265358979323 # Pi
euler = 0.57721566490153386 # Euler-Mascheroni constant
e = 2.718281828459045 # exp(1.)

Physical Constants
avogadro = 6.02214129e23 # Avogadro's Number
amu = 1.66053921e-27 # Atomic Mass Unit [kg]
clight = 2.99792458e+8 # Speed of light in vacuum [m/s]
echarge = 1.602176565e-19 # Proton charge [kg]
emass = 9.10938291e-31 # Electron mass [kg]
eps0 = 8.854187817620389e-12 # Permittivity of free space [F/m]
jprev = 1.602176462e-19 # Conversion factor, Joules per eV [J/eV]
mu0 = 1.2566370614359173e-06 # Permeability of free space [H/m]
boltzmann = 1.3806488e-23 # Boltzmann's constant [J/K]
planck = 6.62606957e-34 # Planck's constant [J.s]
```

Example:

```
>>> pipesec=pi*piperad**2
>>> pipesec
0.008107319665559963
```

11

## Warp script outline

Outline of basic 3D simulation script:

```
from warp import * # Read in Warp
setup() # Setup graphics output

# Setup initial beam -- see "Particles" How To
... python code to describe species and distribution parameters of initial beam

# Setup particle mover -- see "Particles" How To
... python code to setup particle mover including timestep etc.

# Setup simulation mesh and field solver -- see "Field Solver" How To
... python code to set mesh variables and setup fieldsolver

# Setup Lattice defining accelerator -- see "Lattice" How To
... python code to set variables and call lattice setup functions

# Setup simulation diagnostics -- see "Diagnostics" How To
... python code to setup diagnostics

# Generate code
package("w3d"); generate()

# Advance simulation, say 1000 timesteps
step(1000)

# Save dump of run, if desired -- see Saving/Retrieving Data How To
dump()
```

12

## Particles

Warp can handle an arbitrary number of particle species.

### Predefined particle types:

- periodic table, electron, positron, proton, anti-proton, muon, anti-muon, neutron, photon.

### Creating a particle species:

```
beam = Species(type=Potassium, charge_state=+1, name="Beam ions (K+)")
plasma_electrons = Species(type=Electron, name="Plasma electrons", color=red)
plasma_ions = Species(type=Hydrogen, charge_state=+1, name="Plasma ions", color=green)
```

### Accessing species data (sample):

```
beam.sq # gives the charge of the species
beam.charge # same as beam.sq
beam.mass # gives the mass of the species (also given by beam.sm)
beam.emitt # normalized emittance
beam.hxrms # time history of Xrms in the z-windows (as computed by Warp diagnostic)
```

### Using species functions (sample):

```
plasma_electrons.ppzx() # plots the particles in z-x space (the particles will be red).
plasma_ions.getx() # returns a list of all of the plasma ions x positions
plasma_ions.add_uniform_cylinder(...) # creates a cylindrical distribution of particles
```

13

## Creating particles at initialization

### Adding predefined distributions:

```
plasma_ions.add_gaussian_dist(...) # adds Gaussian distribution
plasma_ions.add_uniform_box(...) # adds uniform box
plasma_ions.add_uniform_cylinder(...) # adds uniform cylinder
```

### Adding user defined distributions:

```
def createmybeam():
    ... Python code to set x,y,z,vx,vy,vz
    beam.addpart(x,y,z,vx,vy,vz,...)
    ...
createmymybeam()
```

14

## Creating particles to be injected

### Injecting particles directly:

```
def injectplasma():
    plasma_electrons.addparticles(...)
    plasma_ions.addparticles(...)
    installuserinjection(injectplasma)
```

### Injecting particles from an emitting surface:

```
# --- Specify injection of the particles
top.inject = 1 # particles injected
top.npinject = 15 # Approximate number of
# each step
top.vinject = diode_voltage # voltage on source

# --- Set basic beam parameters
beam.a0 = source_radius
beam.b0 = source_radius
beam.ibeam = diode_current
derivqty()
```

```
Types of injection (top.inject)
0: turned off,
1: constant current,
2: space-charge limited (Child-Langmuir),
3: space-charge limited (Gauss's law),
4: Richardson-Dushman thermionic emission
5: mixed Richardson-Dushman thermionic
and space-charge limited emission
6: user specified emission distribution
7: Taylor-Langmuir ionic emission
8: mixed Taylor-Langmuir ionic and space-
charge limited emission
```

15

## Accessing particles data

### Many functions are available to access particles data:

```
position: getx(), gety(), getz()
velocities: getvx(), getvy(), getvz()
momentum/mass: getux(), getuv(), getuz()
transverse angles (x-velocity/z-velocity etc): getxp(), getyp()
gamma inverse: getgaminv()
particle identification number: getpid()
x-' and y-' statistical slopes of the distribution: getxxpslope(), getyypslop()
```

### Examples:

```
n = beam.getn() # returns macro-particle number
x = beam.getx() # returns macro-particle x-coordinates
y = beam.gety() # returns macro-particle y-coordinates
z = beam.getz() # returns macro-particle x-coordinates
pid = beam.getpid() # returns macro-particle identification numbers
```

### Many arguments are available for downselection of particles based on positions, etc:

```
beam.getx(zl=0.,zu=0.1) # returns x-coordinates for 0.<=z<=0.1
see documentation of selectparticles() for complete description
```

16

## Simulation mesh

### Setting the mesh extents:

```
w3d.xmin = -10.*mm # x-mesh min
w3d.xmax = 10.*mm # x-mesh max
w3d.ymin = -10.*mm # y-mesh min
w3d.ymax = 10.*mm # y-mesh max
w3d.zmin = -250.*mm # z-mesh min
w3d.zmax = 250.*mm # z-mesh max
```

### Setting the number of meshes:

```
w3d.nx = 200 # size of x-mesh, mesh points are 0,...,nx
w3d.ny = 200 # size of y-mesh, mesh points are 0,...,ny
w3d.nz = 1000 # size of z-mesh, mesh points are 0,...,nz
```

### The cell sizes are automatically computed during the call to generate():

```
>>> generate()
>>> w3d.dx, w3d.dy, w3d.dz
(0.0001, 0.0001, 0.0005)
```

17

## Boundary conditions

### Boundary conditions for the fields:

```
w3d.bound0 # lower z-mesh
w3d.boundnz # upper z-mesh
w3d.boundxy # transverse x-y
```

**Valid values:** Dirichlet, Neumann, periodic.

In addition, for the Maxwell solver: openbc (uses the Perfectly Matched Layer).

### Boundary conditions for the particles:

```
top.pbound0 # lower z-mesh
top.pboundnz # upper z-mesh
top.pboundxy # transverse x-y
```

**Valid values:** absorb, reflect, periodic.

18

## Field solvers

### Various field solvers are available in Warp:

```
# multigrid Poisson solvers
fieldsolvers.multigrid.MultiGrid3D() # 3-D geometry
fieldsolvers.multigridRZ.MultiGrid2D() # 2-D x-z geometry
fieldsolvers.multigridRZ.MultiGridRZ() # 2-D r-z geometry

fieldsolvers.MeshRefinement.MRBLOCK3D() # 3-D geometry with mesh refinement
fieldsolvers.MeshRefinement.MRBLOCK2D() # 2-D geometry with mesh refinement

fieldsolvers.multigridRZ.MultiGrid2DDielectric() # solver in 2-D with variable
# dielectric constant (serial only)

# multigrid Magnetostatic solvers
fieldsolvers.magnetostaticMG.MagnetostaticMG() # solver in 3-D geometry
fieldsolvers.MeshRefinementB.MRBLOCKB() # solver in 3-D geometry with mesh refinement

# electromagnetic Maxwell solvers
fieldsolvers.em3dsolver.EM3D() # 3-D, 2-D x-z/r-z, r-z+azimuthal decomposition
fieldsolvers.em3dsolverFFT.EM3DFFT() # spectral (FFT-based) solver in 3-D and 2-D x-z
EM3DPXR() # 3-D, 2-D x-z using optimized PICSAR library (available via PICSAR)
```

19

## Field solvers usage

### Multigrid Poisson solver:

```
solver = MultiGrid3D()
registersolver(solver)
```

### Multigrid Poisson solver with mesh refinement:

```
solver = MRBLOCK3D()
solver.addchild(mins=...,maxs=...,refinement=[2,2,2]) # add refinement level 1
solver.children[0].addchild(mins=...,maxs=...,refinement=[2,2,2]) # add ref. level 2
registersolver(solver)
```

### Electromagnetic Maxwell solver:

```
solver = EM3D() # 3D solver
registersolver(solver)
```

```
solver = EM3D(\_2dxx=True) # 3D solver
registersolver(solver)
```

```
solver = EM3D(\_2drz=True) # axisymmetric RZ solver
registersolver(solver)
```

```
solver = EM3D(circ_m=1) # axisymmetric RZ solver + first azimuthal dipole mode
registersolver(solver)
```

20

## Internal conductors

Many primitives can be combined to define internal conductors

### Cylinders:

```
Cylinder (radius, length, theta=0., phi=0., ...)
ZCylinder (radius, length, ...)
ZCylinderOut (radius, length, ...)
ZCylinderElliptic (ellipticity, radius, length, ...)
ZCylinderEllipticOut (ellipticity, radius, length, ...)
ZRoundedCylinder (radius, length, radius2, ...)
ZRoundedCylinderOut (radius, length, radius2, ...)
XCylinder (radius, length, ...)
XCylinderOut (radius, length, ...)
XCylinderElliptic (ellipticity, radius, length, ...)
XCylinderEllipticOut (ellipticity, radius, length, ...)
YCylinder (radius, length, ...)
YCylinderOut (radius, length, ...)
YCylinderElliptic (ellipticity, radius, length, ...)
YCylinderEllipticOut (ellipticity, radius, length, ...)
Annulus (rmin, rmax, length, theta=0., phi=0., ...)
Zannulus (rmin, rmax, length, ...)
ZAnnulusElliptic (ellipticity, rmin, rmax, length, ...)
```

### Surfaces of revolution:

```
ZSrfvOut (rsrf,zsrf,rad,rc,zc,...)
ZSrfvOut (rofzfunc,zmin,zmax,...) / XSrfvOut (rofzfunc,xmin,xmax,...) / YSrfvOut (rofzfunc,ymin,ymax,...)
ZSrfvIn (rofzfunc,zmin,zmax,...) / XSrfvIn (rofzfunc,xmin,xmax,...) / YSrfvIn (rofzfunc,ymin,ymax,...)
ZSrfvInOut (rminofz,rmaxofz,...) / XSrfvInOut (rminofx,rmaxofx,...) / YSrfvInOut (rminofy,rmaxofy,...)
ZSrfvEllipticOut (ellipticity,rofzfunc,zmin,zmax,rmax,...)
ZSrfvEllipticIn (ellipticity,rofzfunc,zmin,zmax,rmin,...)
ZSrfvEllipticInOut (ellipticity,rminofz,rmaxofz,zmin,zmax,...)
```

### Planes/Rectangles:

```
Plane (z0=0.,zsign=1,theta=0.,phi=0.,...)
XPlane (x0=0.,xsign=1,...)
YPlane (y0=0.,ysign=1,...)
ZPlane (z0=0.,zsign=1,...)
Box (xsize,ysize,zsize,...)
```

### Cones:

```
Cone (r_zmin,r_zmax,length,theta=0.,phi=0.,...)
ConeOut (r_zmin,r_zmax,length,...)
ZConeOut (r_zmin,r_zmax,length,...)
ConeSlope (slope,intercept,length,theta=0.,phi=0.,...)
ZConeSlope (slope,intercept,length,...)
ConeOutSlope (slope,intercept,length,...)
```

### Others:

```
Sphere (radius,...)
ZEllipsoid (ellipticity,radius,...)
ZTorus (r1,r2,...)
ZGrid (xcellsize,ycellsize,length,thickness,...)
Beamletplate (za,zb,z0,thickness,...)
CADconductor (filename,voltage,...)
```

Help: generateconductors\_doc () 21

## Internal conductors properties & usage

The internal conductors may have the following properties:

```
Voltage = 0. # conductor voltage
Condid = 'next' # conductor ID; will be set to next available ID if 'next'
Name = None # conductor name
Material = 'SS' # conductor material type (for secondaries), other options are 'Cu', 'Au'
Conductivity = None # conductor conductivity (for use with Maxwell solver)
Permittivity = None # conductor permittivity (for use with Maxwell solver)
Permeability = None # conductor permeability (for use with Maxwell solver)
Laccuimagecharge = False # if True, collect history of particles charge accumulated/emitted
# by/from conductor, as well as image charges from nearby particles
# (using integral of Gauss Law around conductor)
```

Examples:

```
# --- addition of two conductors
z1 = ZCylinder(0.1,1.0,zcent=-0.5,voltage=-1.*keV)
z2 = ZCylinder(0.12,1.0,zcent=+0.5,voltage=+1.*keV)
zz = z1 + z2
installconductor(zz)

# --- subtraction of two conductors
souter = Sphere(radius=1.,voltage=1.)
sinner = Sphere(radius=0.8,voltage=souter.voltage,condid=souter.condid) # conductors must have same ID
shollow = souter - sinner

# --- intersection of two conductors
zz = ZCylinder(0.1,1.0,voltage=10.*keV)
yy = YCylinder(0.1,1.0,voltage=zz.voltage,condid=zz.condid) # conductors must have same ID
installconductor(zz*yy)
```

Help: generateconductors\_doc () 22

## Internal conductors as a surface of revolution

The internal conductors may have the following properties:

```
# --- Source emitter parameters
channel_radius = 15.*cm
diode_voltage = 93.*kV
source_radius = 5.5*cm
source_curvature_radius = 30.*cm # --- radius of curvature of emitting surface
pierce_angle = 67.
plate_width = 2.5*cm # --- thickness of aperture plate
piercezlen = 0.04

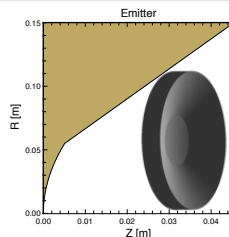

piercezlen = (channel_radius - source_radius)*tan((90.-pierce_angle)*pi/180.)
rround = plate_width/2.

# --- Outer radius of Pierce cone
rpierce = source_radius + piercezlen*tan(pierce_angle*pi/180.)

# --- Depth of curved emitting surface
sourcezlen = (source_radius**2/(source_curvature_radius + sqrt(source_curvature_radius**2 - source_radius**2)))

# --- the rsrf and zsrf specify the line in RZ describing the shape of the source and Pierce cone .
# --- The first segment is an arc, the curved emitting surface.
source = ZSrfv(rsrf=[0., source_radius, rpierce, channel_radius, channel_radius],
              zsrf=[0., sourcezlen, sourcezlen + piercezlen, sourcezlen + piercezlen, 0.],
              rc=[source_curvature_radius, None, None, None, None],
              r=[0., None, None, None, None],
              voltage=diode_voltage)

# --- Create emitter conductors
installconductor(source, dfill=largepos)
```

Help: generateconductors\_doc () 23

## Lattice

The easiest and most elegant way to setup a lattice in Warp uses a MAD-like syntax.

List of lattice elements:

```
Drft() # drift
Bend() # bend
Dipo() # dipole
Quad() # quadrupole
Sext() # sextupole
AccL() # accelerating gap
Hele() # hard edge multipole
Emlt() # electric multipole
Mmlt() # magnetic multipole
Bgrd() # gridded B-field
Pgrd() # gridded E-field
```

Usage:

```
qf = Quad(l=10.*cm,db= 1.5,ap=3.*cm) # focusing magnetic quadrupole
qd = Quad(l=10.*cm,db=-1.5,ap=3.*cm) # defocusing magnetic quadrupole
dd = Drft(l=5.*cm,ap=3.*cm) # drift
fodo1 = qf + dd + qd + dd # 1 FODO section
s1 = 10*fodo # section 1 is a repetition of 10 fodo1
...define s2 # define section 2
...define s3 # define section 3
lattice = s1+s2+s3 # the lattice is the sum of the 3 sections
madtowarp(lattice) # converts MAD-like lattice into Warp native format and initializes

or

getlattice(file) # reads MAD lattice from file, converts and initializes
# (not all MAD files are readable without tweaking file or Warp reader)
```

Note: Maps elements also exist for quads, bends, drifts and RF Kicks.

Help: latticedoc() 24

## Stepping

The main stepping is performed by calls to the function step:  
step(nstep)

The user can add functions to be called before and after step:

```
@callfrombeforestep # installs next function to be called automatically before a step
def myplotfunc1():
    ...

@callfromafterstep # installs next function to be called automatically after a step
def myplotfunc2():
    ...
```

### Example

```
plotfreq = 100 # --- frequency of plotting
@callfromafterstep
def myplotfunc():
    if top.it%plotfreq==0: # --- execute only every plotfreq time steps
        beam.ppxz() # --- plot ZX projection
        fma() # --- save plot and clear for next plot
```

25

## Plotting basics

Generic plotting subroutines: type doc(subroutine) for list of options

```
setup() # setup graphics output
winon(i) # open window number i (0<=i<10)
window(i) # select window number I (opens window if not already)
pgeneric() # generic particle and fields plotting routine
pla() # plot a graph of y vs x
limits() # sets plot limits in order left, right, bottom, top
ptitles() # draw plot titles on the current frame
fma() # frame advance
refresh() # refresh of window for live plots
eps('filename') # output current plot in epsi file
pdf('filename') # output current plot in pdf file
```

### Viewing file:

```
gist myfile.cgm # open graphic output file
gist commands:
  f (or F) - Forward one frame      b (or B) - Backward one frame
  10f - Forward 10 frames           F - Forward n frames
  10b - Backward 10 frames         B - Backward n frames
  10n - Set n to 10 (10 is the default)
  r - Redraw current frame
  g - Goto first frame              G - Goto last frame
  s - Send current frame to output device (see below for more info)
  q - Quit
```

26

## Plotting particles

### Particle projection examples:

```
beam.ppxy() # --- projection in X-Y
beam.ppxvx() # --- projection in X-Vx
beam.pptrace() # --- Plots X-Y, X-X', Y-Y', Y'-X' in single page
```

### List of all projections:

beam.pprp()	beam.ppxux()	beam.ppyvz()	beam.ppzuz()
beam.pprtp()	beam.ppxvx()	beam.ppyyp()	beam.ppzvperp()
beam.pprvr()	beam.ppxvz()	beam.ppzbx()	beam.ppzvr()
beam.pprvz()	beam.ppxxp()	beam.ppzby()	beam.ppzvtheta()
beam.pptrace()	beam.ppxy()	beam.ppzbz()	beam.ppzvx()
beam.ppzvperp()	beam.ppybx()	beam.ppzex()	beam.ppzvy()
beam.ppxbx()	beam.ppyby()	beam.ppzey()	beam.ppzvz()
beam.ppxby()	beam.ppybz()	beam.ppzex()	beam.ppzx()
beam.ppxbz()	beam.ppyex()	beam.ppzke()	beam.ppzxp()
beam.ppxex()	beam.ppyey()	beam.ppzr()	beam.ppzxy()
beam.ppxey()	beam.ppyez()	beam.ppzrp()	beam.ppzzy()
beam.ppxez()	beam.ppyuy()	beam.ppzux()	beam.ppzyp()
beam.ppxyp()	beam.ppyvy()	beam.ppzuy()	

### History plots:

Many history plots (vs time or vs z) are available  
histplotsdoc() # --- list of available plots  
hpdoc() # --- list of possible arguments

## Plotting fields (electrostatic)

### List of all projections:

Plots contours of charge density (rho) or electrostatic potential (phi) or self E fields in various planes.

pcrhozy()	pcrhozx()	pcrhoxy()	# charge density
pcphizy()	pcphizx()	pcphixy()	# scalar potential
pcselfezy()	pcselfezx()	pcselfexy()	# self electric field
pcjzy()	pcjzx()	pcjxy()	# current density
pcbzy()	pcbzx()	pcbxy()	# magnetic field
pcazy()	pcaxz()	pcaxy()	# vector potential

28

## Plotting fields (electromagnetic)

### Main functions:

```
em = EM3D()
# --- plotting electric field components in x, y, r, theta, z
em.pfex(); em.pfey(); em.pfer(); em.pfet(); em.pfez()
# --- plotting magnetic field components in x, y, r, theta, z
em.pfbx(); em.pfby(); em.pfbr(); em.pfbr(); em.pfbz()
# --- plotting current density components in x, y, r, theta, z
em.pfjx(); em.pfjy(); em.pfjr(); em.pfjt(); em.pfjz()
# --- plotting charge density
em.pfrho()
```

### Options (in addition to those of ppgeneric):

```
- l_transpose=false: flag for transpose of field
- direction=None: direction perpendicular to slice for 2-D plot of 3-D fields
                  (0='x', 1='y', 2='z')
- slice=None: slice number for 2-D plot of 3-D fields (default=middle slice)
```

### Examples:

```
# --- plotting of Ez in plane Z-X
em.pfez(direction=1, l_transpose=1)
# --- plotting of Ex in plane X-Y
em.pfex(direction=2)
```

29

## Saving/restarting/retrieving

### Saving/restarting Warp simulations:

```
dump() # dumps simulation in external file
restart('filename') # restart simulation from file
```

### Saving/retrieving data in external binary files:

```
# --- saving
fout = PWPickle.PW("save.pkl")
fout.var = var
fout.close()
# --- retrieving
fin = PRpickle.PR("save.pkl")
var = fin.var
fin.close()
```

By default, binary files use Python pickle format. Other formats (e.g. hdf5) are available.

Saving in the new PIC I/O standard OpenPMD is also possible with the electromagnetic PIC solver.

30

## Command line options

### Saving/restarting Warp simulations:

```
-p, --decomp npx npy npz # Specify the domain decomposition when running in parallel.
                          # The npx, npy, and npz are the number of domains along the x, y,
                          # and z axes. Note that npx*npy*npz must be the same as the total
                          # number of processors.
```

```
--pnumb string # Specify the runnumber to use, instead of the automatically incremented
                # three digit number. Any arbitrary string can be specified.
```

### Example when running in parallel:

```
# --- run on 64 cores, with decomposition of 4 in x, 2 in y and 8 in z, with mpi4py
mpirun -np 64 python myscript.py -p 4 2 8
```

### User specified line arguments:

```
import warptions # --- first import warptions module
# --- add arguments
warptions.parser.add_argument('--radius', dest='radius', type=float, default=0.)
warptions.parser.add_argument('--voltage', dest='voltage', type=float, default=0.)
from warp import * # --- import Warp
radius = warptions.options.radius
voltage = warptions.options.voltage
```

```
Usage: python -i myinputfile.py --radius 7.0 -voltage 93000.
```
