W3. Examples Warp Simulations

Jean-Luc Vay
 Lawrence Berkeley National Laboratory

Outline

- Emission between parallel plates
- Pierce diode
- Quadrupole transport
- Solenoid transport
- Plasma acceleration

Emission between parallel plates

Was given as a problem yesterday. Any question?

Pierce diode: intro

File Pierce_diode.py

Hot plate source emitting singly ionized potassium.

File Pierce_diode.py

Pierce diode: tasks

- ① Open Pierce_diode.py
- ② Execute file: "python -i Pierce_diode.py"
- ③ Open cgm files and explore:
 - a) "gkst Pierce_diode.000.cgm &"
 - b) "gkst current.cgm &"
- ④ Read input script and try to understand every command
- ⑤ Comment "w3d.solvegeom = w3d.rzgeom", uncomment "w3d.solvegeom = w3d.xyzgeom" and rerun; observe longer runtime but similar result
- ⑥ Reverse to RZ geometry
- ⑦ Set "steady_state_gun=True" and rerun. Simulation is now generating traces, converging to steady-state solutions faster than with time-dependent mode.
- ⑧ Set "w3d.l_inj_regular = True", "top.npinject = 15" and rerun with regularly spaced traces. This option can be used to enable clean and fast convergence to steady-state.
- ⑨ Change "diode_current = pi*source_radius**2*j" to "0.5*pi*source_radius**2*j", then "2*pi*source_radius**2*j" and rerun each time. What do you observe?

5

Pierce diode: tasks

- ⑨ Go back to original settings
 - steady_state_gun=False
 - w3d.l_inj_regular = False
 - top.npinject = 150
 - diode_current = pi*source_radius**2*j
 then change
 - beamplots(False) → beamplots(True)
 - top.inject=1 → top.inject=2 so that extracted current is at Child-Langmuir limit to given voltage
 Rerun. Open the latest cgm file, page through and observe how the head of the beam has a larger current and touches the extractor. Why?
- ⑩ Set "l_constant_current = True" and rerun, observing how the injected current is now constant. Also observe the history of the applied voltage versus time.

6

Solenoid transport

File Solenoid_transport.py:

- Example Pierce diode with subsequent solenoid transport.
- Hot plate source emitting singly ionized potassium.

7

Solenoid transport: tasks

- ① Open Solenoid_transport.py
- ② Execute file: "python -i Solenoid_transport.py"
- ③ Open cgm file and explore:
 - a) "gkst Solenoid_transport.000.cgm &"
- ④ Read input script and try to understand every command
- ⑤ Change "l_solenoid = False" to "l_solenoid = True". Rerun.
- ⑥ Select window(1)
- ⑦ Type "fma()" to start next plot from empty page.
- ⑧ Type "rzplot(9)" to plot RZ view of beam, pipe and solenoids in upper half.
- ⑨ Type "ppztheta(10)" to plot particle projections of azimuthal velocity versus z.
- ⑩ Notice the correlations between the maximums of the azimuthal velocity and the positions of the solenoids.

8

Quadrupole transport – 3D

The figure contains four subplots. The top-left plot is 'X vs Z', showing a beam distribution in the X-Z plane with alternating 'F' and 'D' quadrupoles. The top-right plot is 'Electrostatic potential in z-x plane', showing a potential well with a central region of high potential. The bottom-left plot is 'Y vs Z', showing a beam distribution in the Y-Z plane with alternating 'D' and 'F' quadrupoles. The bottom-right plot is 'Electrostatic potential in z-y plane', showing a potential well with a central region of high potential.

File FODO3D.py - basic 3D simulation of an ion beam in a periodic FODO lattice:

- Sets up a periodic FODO lattice and creates a beam that is matched to the lattice.
- The beam is propagated one lattice period.

FODO3D: tasks

- 1 Open FODO3D.py
- 2 Execute file: "python -i FODO3D.py"
- 3 Open cgm file and explore:
 - a) "gist FODO3D.000.cgm &"
- 4 Compare the slices emittance diagnostics to the whole emittance diagnostic. Can you explain the differences (i.e. one is constant, the other oscillates)?
- 5 Read input script and try to understand every command
- 6 Change 'w3d.distrbtn = "semigaus"' to 'w3d.distrbtn = "KV"' ; rerun & observe
- 7 Change 'w3d.distr_l = "gaussian"' to 'w3d.distr_l = "neuffer"' ; rerun & observe
- 8 Insert "beam.x0 = beam.a0/2" on the line following "beam.a0 = ..."; rerun & observe
- 9 Check that you have the "ffmpeg" software installed: "which ffmpeg"
 - If not, download and install ffmpeg
- 10 Change "_movieplot = False" to "_movieplot = True" & rerun
 - If all goes well, after a few minutes, you should have a movie "movie.mp4"

Quadrupole transport – XY

The figure contains two subplots. The left plot is titled 'Env Code: RMS x [b] and y [r] Envelopes + Foc Func [g]', showing the RMS envelopes for x and y and the focusing function over a distance s [m]. The right plot is a contour plot showing the beam distribution in the x-y plane, with x and y axes in mm.

File xy-quad-mag-mg.py:
nonrelativistic Warp xy slice simulation of a K⁺ ion beam with intense space-charge focused by a hard-edge magnetic quadrupole doublet focusing lattice.

xy-quad-mag-mg: tasks

- 1 Open xy-quad-mag-mg.py
- 2 Execute file: "python -i xy-quad-mag-mg.py"
- 3 Open cgm file and explore:
 - a) "gist xy-quad-mag-mg.000.cgm &"
- 4 Read input script and try to understand every command.
- 5 Comment 'w3d.distrbtn = "SG"' and uncomment 'w3d.distrbtn = "KV"', rerun and compare to results using the KV vs SG distributions.
- 6 Change the initial emittance "emit = 10.e-6" to "emit = 10.e-7", rerun and observe effect on matching and emittance preservation.
- 7 Change switch "_automatch = False" to "_automatch = True", rerun and observe difference with previous run.
- 8 With the simulation back at the python prompt, type 'dump()', then run for another 500 steps: "step(500)".
- 9 In another terminal, start python and type:
 - from warp import *
 - restart('xy-quad-mag-mg001000.dump')
 - step(500)

Reopen "xy-quad-mag-mg.000.cgm" and compare to "xy-quad-mag-mg.001.cgm".

Plasma acceleration

Scripts lpa_script.py, lpa_script_2d.py, pwfa_script.py – basic plasma acceleration runs:

- Generate plasma, laser or beam driver, and injected electron beam and follow self-consistent evolution.

13

Plasma acceleration tasks

- ① Open lpa_script.py: the first command reads “from warp_init_tools import *”
 - the warp_init_tools package contains utility subroutines for easy setup of lasers and continuous injections of plasmas.
- ② Download the archive
https://github.com/RemiLehe/uspas_exercise/raw/master/warp-init-tools.tar
 then execute:
 - untar the file: “tar -xvf warp-init-tools.tar”
 - cd warp-init-tools
 - python setup.py install
- ③ Execute the files “python -i lpa_script.py” and “python -i pwfa_script.py” separately.
- ④ It takes some time to run. While it runs, you may open periodically the cgm files ***_script.000.cgm and see the progress. In the meantime, also go through the input and try to understand all the commands.
- ⑤ At the end of the run, a plot display the energy of the accelerated beam versus z.
- ⑥ Install OpenPMD notebook viewer and start. While exploring data, run 2000 additional time steps.

14

Laser plasma acceleration tasks

- ⑦ Open the file lpa_script_2d.py and execute
- ⑧ Open cgm file and explore:
 - a) “glist lpa_basic_2d.000.cgm &”
- ⑨ Read input script and try to understand every command.
- ⑩ Run the script ptime displaying the history of the elapsed time and the time per step. Observe the spikes from the diagnostics.
